INTRODUCTION

The programs presented here are set out for the individual who has a specific need in mind. Because a detailed discussion of these programs would require a text several times the present size of this Library it has been omitted. Individuals who have a specific requirement will have to be at least knowledgeable in the area the program is written about; ie: Statistical programs require the user to be familiar with the terms mean, median, etc. This is because the programs are written in the vernacular of their subject matter. With this knowledge alone, no programming experience on the part of the user is required in order to use any of these programs in most systems. Once it is determined that a particular program may be useful the user merely types in a copy of the BASIC source code exactly as it appears in the program listing. Then follow the instructions for running the program as presented in the Instruction portion of the write up, immediately preceding the program. Also included in the write ups are statements that appear in the source code which may possibly need to be changed to run in the user's computer system; ie: RND statements may have to be changed to FRAND in order to compile in certain systems.

PUBLISHERS NOTE: Appendix B included at the end of Volume V was not mentioned in the preface by the author. We feel this appendix is the most important single item included in this library. We see this appendix as a fore runner that might lead the way toward standardizing a computer language among the manufacturers. This is in addition to the obvious benefits to all users of this Basic Software Library.

A Complete Business System

PREFACE

The information contained in these pages represents the culmination of a very large project. That of compiling a versatile and complete Software Library that will be of use to a large number of diverse individuals. The programs presented here when combined in a system will represent a very powerful library bank. Such a work as this has been attempted in the past in such areas as cook books, electronic source books, mathematical tables and even computer games. But to date such a collection as this has yet to be offered to the average individual to use as he chooses. The word "at - temped" was used as no work is ever considered complete by everyone regar dless of its thoroughness.

The programs presented here were chosen for their uniqueness and general usefulness. There should be at least one program included that will be of use to every type of individual whether they have access to a computer or not. Computers are a wonderful and very useful tool. Through this Library I hope to interest more people into becoming involved with computers. The Library is written so that little or no computer programming experience is required to invoke any of the programs. The programs that are present- ed here are all written in the computer language called BASIC. Each pro - gram has been successfully run on a G.E. 635 computer. The entire source code is presented as well as a short narrative page which defines the pro gram, tells who might be interested in using it, a brief set of instruc- tions or how to get them and then any limitations in the program are no- ted. In the limitations section the storage length in K Bytes is given so the prospective user will know how much memory to allow for the program. Where possible the amount of memory space required for full execution is given for the programs, this space is independent of the space already oc cupied by your BASIC compiler.

The programs are broken down into five sections or parts. Each part deals with a specific type of program. Part 1 contains business type programs. These programs will be of interest to individuals who have businesses, play the stock market, balance their own checkbooks, do installment buy- ing, figure taxes, etc. There are a total of 20 programs in this section. Part 2 is the lighter side of the Library as it contains 16 games and 12 picture programs. No computer library is complete without some fun. Among the games presented in this section is one called Checkers. The game is rather long but it is virtually machine independent as it doesn't use over lay techniques or use files. Most of the other games included here are as exciting as this version of Checkers. Each was chosen so as not to mimic others that the reader may have seen. The pictures are as unusual in their own way as are the games. Most of the pictures are spread over several pa ges, this was done not only so the reader will need to run the program to see the details of a particular picture but also in the hopes of getting as many of these programs into use as possible. As the picture programs are very simple it is an easy place for the novice to start learning about programming.

Part 3 is comprised of Math and Engineering programs. Some of these programs will be of use to high school students, professional people, sailors, engi- neers, astronomers, airplane pilots, etc. Most of these programs are very

technical but they can perform every day calculations quickly and easily and they are extremely simple to use. There are 23 general usage programs presented in this section.

Part 4 is made up of Plotting and Statistical Analysis programs. These programs can be readily utilized by a number of people in widely different disciplines from fishermen to statisticians. The data gathered may be from a poll, a census, a test sample or even the number of fish caught on various days. The stat programs will be of invaluable aid to anyone who gathers data of any kind. The plotting routines will be of use to most of the people who use the stat programs or programs in Parts 1 and 3. The plotting is done on any standard teletype or terminal and does not require a special plotter or plotting terminal. There are a tot al of five direct plotting programs and 18 stat programs in this section.

All of the programs presented here may be run by simply typing the source code as listed, exactly as it is, into your computer. Now before the program will run it will have to be converted into machine code. This is done automatically and requires no forethought except to make certain the operating system you are working in is BASIC. In the larger computer systems you are asked what system you want — to this type BASIC; the smaller sys tems only have BASIC, in these you are O.K.

Immediately following Part 4 is Appendix A. Here, all of the Basic Statements used throughout these pages are defined. Each statement is explained sufficiently well to enable one unfamiliar with this subset to modify any necessary statements so that the program or programs will compile and execute with the Basic compiler or interpreter available with their particular computer. Most of the Basic compilers available today, that require more then 10K Bytes of storage, will execute all of the programs presented in these volumes with the possible exception of a few of the games and the program "Variable". Multiple line statements are not used in most of the programs and only a few programs use string manipulations extensively. A few of the programs may require more on line storage then is available on some of the small micro computer systems; these longer programs will not be executable due to the limited amount of memory. However most of the programs will execute in 10K Bytes of memory or less, thereby making most of the programs in this Library executable in virtually any Basic speaking computer without any required modifications.

Volume III is comprised of ADVANCED BUSINESS programs, part 5. This volume as well as subsequent volumes are intended to make this Library complete and useful to all individuals.

Each of these programs are written in a subset of the Dartmouth language. The specific subset is that which was used by General Electric on their 635 systems. These programs have operated without problem on a variety of small and large machines even several of the new micro computers. The pro grams that use string manipulations may require slight modifications before fully executing on some systems. These programs are mainly found in Part 2 — Games.

All of the programs in this Library were written or edited by the author. All of the programs edited by him were given for inclusion, "swapped" for traded, or made public. A few of the original authors of the "swaps" are not known, for this I apologize. The others, unless specifically mentioned in the text, are presented here. In addition I would like to thank the fol lowing for their cooperation in making this work possible.

PART 3

MATH

AND

ENGINEERING

BEAM:

DESCRIPTION

This program calculates the proper steel beam to be used for a particular application. The support may be subjected to the following conditions:

(L1.) Uniformly distributed load
(L2.) Midpoint load
(L3.) Two symmetric loads
(B1.) Support at both ends
(B2.) One end supported, other end fixed
(B3.) Both ends fixed
(B4.) Cantilever

USERS

This program lends itself to construction type projects; such as building an addition to your house or garage, dams, bridges, transmission towers, etc.

INSTRUCTIONS

This program will ask if you want instructions when it is run. The output from the running of the program will be the standard nomenclature designation for the proper beam best suiting your needs. The weight of the beam is also taken into account when the calculations are performed.

LIMITATIONS

The program will store in 5K Bytes of memory. It should execute in any standard Basic speaking computer.

CONV:

DESCRIPTION

Conv calculates convolutions in the time domain. The calculations may be done for data points or for equations. The calculations are performed by integrating the function over the interval, with a very large number of increments (1000 or more). Due to this, the answer will only be approximate and the running time may be excessive.

USERS

Mathematicians, Physicists, and Electrical Engineers will have use for this program. This program is a very powerful tool for determining impulse responses, antenna responses, and system transforms.

INSTRUCTIONS

The program will list all necessary instructions. If the convolution is for equations they must be entered between lines 1680 and 1700 before the program is run; upon running type a 1 to the first response and a Ø to the second response. If the input consists of data, type in the # of data points you have to the first response and then enter your data points at the second response.

LIMITATIONS

Lines 1080 and 1090 contain MAT = ZER statements. A3 in line 1370 may be made larger for greater accuracy, however this will increase the running time. I(MAX) * I(INCREMENT) $\geq$ 1/2 for proper program operation. The source code is 3K Bytes long and execution space requirements will be a function of the DIM statement on line 1020

FILTER:

DESCRIPTION

This program designs and calculates components for low pass filters. The filter is designed using constant K T sections and M - derived L sections. As many as 9 sections may be combined to give specific notch rejections a-above the rolloff frequency.

USERS

Audio enthusiasts can use this program to design special tone circuits. The ham radio operator who wishes to suppress harmonics from his transmitter is still another user. Anyone who designs AF or RF circuits will be able to benefit from use of this program.

INSTRUCTIONS

Before the program is run your data must be entered in lines 10 thru 29. The format is as follows:

```
     10 DATA  R,C,N,F(1),F(2),.................
```

where

- R - is the input and output impedance
- C - is the rolloff frequency in Hertz
- N - is the number of notch frequencies
- F(1) - is the frequency for the first notch
- F(2) - is the frequency for the second notch, etc.

Then type RUN. Additional instructions may be obtained by listing the program.

LIMITATIONS

This program should store and execute in 4K Bytes of memory.

```

FIT:

DESCRIPTION

This program performs interpolations using spline fits. The interpolation may be on data points, or integration limits, or anything else that needs to be interpolated.

USERS

This program is oriented toward individuals who analyze data or do interpolations for other reasons.

INSTRUCTIONS

Enter your data before the program is run; in the following format:

```
     1900  DATA    X,I
     1901  DATA    X(1),Y(1),X(2),Y(2),.....
     19__ DATA     ..........................
     1990  DATA    I(1),I(2),................
```

where

X = number of X and Y data points
Y = number of interpolations wanted

and

X(1) = first X point
Y(1) = corresponding Y point
I(1) = first point where interpolation is desired

After the data has been entered type RUN.

LIMITATIONS

Line 15 contains a Restore statement. The source code is 3K Bytes long and execution space is a function of the size of the DIM statements in lines 1100, 1110, 1121, 1122 and 1123. The program is set for 50 data sets in the DIM statements; this will require about 8K Bytes just for storage of the variable tables. With the DIM set at 50, the program will require 11K Bytes of memory for execution. The sample problem designs a low filter with 50ohm impedance, 20 KHz rolloff, and 2 antenuators in the stop band; 455 KHz and 91 KHz.

INTEGRATION 1:

DESCRIPTION

This math program evaluates definite integrals. The integrals are calculated using the Gaussion quadrature techniques. For this, ten values of the integrand are used. This program is only used to evaluate discrete equations; for data sets see Integration 2.

USERS

This program will find many users among all types of engineers, physicists, and mathematicians. The program is useful anywhere anyone needs integration.

INSTRUCTIONS

Enter your function in line 100. The format is as follows:

```
100  LET Y = f(x)
```

Then type RUN. The program will ask for L, U, and N, where:

L = lower limit
U = upper limit
N = number of intervals to take

To stop the program type Ø,Ø,1 to the L,U,N question.

LIMITATIONS

This program will require about 2K Bytes for storage and 3K Bytes of memory for execution.

L, U, N = ?0,0,1
```

INTEGRATION 2:

DESCRIPTION

This integration program performs integration by spline fits. The function may be defined by unequally spaced data points instead of an equation, as in Integration 1. Integration 2 is used to integrate a function described by data points and not an equation as in the previous program.

USERS

This program would have more appeal and use to individuals who gather data then would Integration 1.

INSTRUCTIONS

Your data must be entered before the program is run. The format for the data entry is as follows:

```
700  DATA    X
701  DATA    X(1),Y(1),X(2),Y(2),.....
```

where

X - is the number of data sets to be used
X( ) and Y( ) are the corresponding data points

Then type RUN.

LIMITATIONS

Line 19 contains a Restore statement. The source code will store in 3K Bytes of memory. The execution space is about 11K Bytes when set for 50 data sets. The number of data sets the program will handle is set in the DIM statements on lines 170, 180, and 190.

INTENSITY:

DESCRIPTION

This program will compute wave interactions. The wave may be acoustical - such as sonar or hydrosonics, RF - such as VHF television, or it may be optical - such as infared light. Given the array size and spacings in wavelengths of the wave the program will calculate and plot the directivity of the array, antenna, or transducer.

USERS

This program is useful to anyone who is interested in directive emitters. The marine engineer who is designing side scan sonar systems, the ham radio operator who wants to build a highly directional beam, or the engineer who is working with the new IR and optical military weapon systems.

INSTRUCTIONS

List the program for all necessary information. The plotting is in 9 degree increments from Ø to 90 degrees. If other limits or resolutions are desired modify lines 1750 and 1760.

LIMITATIONS

This program will store in 7K Bytes of memory and execute in 9K Bytes of memory. The plotting can be done on any standard teletype terminal.

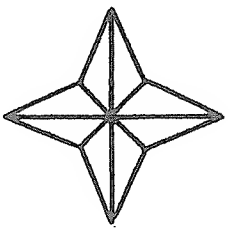
The first data entry prompted for by the program is the values for A, B and D1. The possible values for these variables are listed just prior to their input. A and B may be 1, 2 or 3 and D1 may be Ø, 1 or 2. The value of 1 is normally used for A, the equations have sin (X) dependency. Sin (X) dependent equations have a peak response at Ø degrees or on axis. B is usually 3, which yields normal antenna response. The particular equation Z1, Z2 or Z3 that satisfies your system response will ultimately determine the value of B for your problem. D1 is a bit simpler. If D1 is set equal to Ø, the graph plots the absolute value of the function. If equal to 1 the function itself is plotted, the function will have values on both sides of zero. If D1 is set equal to 2, then the intensity function is plotted.



Sample Run of Intensity

Example #1

Determining the effect on directivity by varying the N,S, and L ratios.
Where

N = Total number of elements
S = Element spacing in wavelengths
L = Average array width in wavelengths

For this array we chose sin (X) dependency and Z3 = Z1 * Z2. Then plot the amplitude of the results between Ø degrees and 90 degrees. The plot is symmetrical from 270 degrees to Ø to 90 degrees. Where Ø degrees is the direction the array or antenna is pointing. The first plot is done for 9 degree increments as we are looking for the gross effects in this example. This plot is to be used as a reference which will be compared against the other examples. In this plot N = 10, S = 1 wavelength and L = 1 wavelength. It can be seen that the half power points are about 20 degrees wide, twice 10 degrees. The small curve represented by "+" represents the dependent function, sin (X) as set initially. This second curve is used to indicate proper operation.

For the second plot N is left at 10, S is changed to 5 and L is left at 1. This array now has half power points at about 10 degrees. This means that by taking the same array as above and only changing the spacing between the elements the directivity has been doubled. However the side bands have also been doubled, this is normally not a desireable effect.

For the third plot N = 10, S is reset to 1 and L is widened to 5 wavelengths. Here the half power points are 20 degrees but the side lobes are considerably less then in the first plot.

For the fourth plot N has been increased to 50, S and L both set equal to 1 wavelength. Now the half power points for this combination is again 10 degrees but the side lobes are almost completely eliminated.

Example #2

This example examines the effects of infared light that is emitted from a #47 light bulb. The plot is contained on two pages. The outer envelope "+" represents the diffraction effects when focused by a perfect lense. The inner envelope "*" represents the intensity of the radiation very close to the axis of orientation.

LOLA:

DESCRIPTION

This is a navigation program and will enable the user to determine position in latitude and longitude from data supplied from sextant readings and a nautical almanac.

USERS

Anyone who wants to determine his location with a sextant and doesn't want to go through the laborious hand calculations would find LOLA very useful. This would include most small vessel owners and crewmen.

INSTRUCTIONS

List the program for instructions. All inputs are entered while the program is running.

LIMITATIONS

Execution and storage of Lola will require about 6K Bytes of memory in most computer systems.

LULA

MACRO:

DESCRIPTION

This program simulates a high level language assembler. The program may also be used to study emulator functioning. It can also be used to amuse yourself while trying to determine what Macro is doing.

USERS

The cypher enthusiast, advanced programmer, and computer system analyst will find this program useful and enjoyable. Not recommended for the novice.

INSTRUCTIONS

Macro requires an Input use file and an Output use file. The Output file is not used in this version and may be deleted from line 170 if desired. To use this program you must pick an available file, preferably one with something in it. Then name it in the File Input Statement and type RUN. The teletype will then display the compiling function. The Input use file is not altered.

LIMITATIONS

In line 170 there is a FILES statement. The SST( ) statement is used extensively throughout this program. This program requires file manipulations. This program stores in 2K Bytes of memory. Execution length is a function of the length of the designated Input file.

MAX. MIN.:

DESCRIPTION

This program calculates the maximum, minimum, and zero points, if they exist, of any function over any fixed interval.

USERS

People solving equations for roots or extreme values could put this program to very good use, such as: high school students, engineers, etc.

INSTRUCTIONS

Enter all of your data into the program before execution, in the following format:

```
100 DATA  MIN,MAX,ACC,INC
200 Let Y = f(x)
```

where

MIN and MAX - define the interval
ACC - is the accuracy number of significant figures desired
INC - number of increments the interval is divided (try 100)

Then type RUN.

LIMITATIONS

Max. Min. will store in 3K Bytes of memory and execute in 4K Bytes.

MAX. MIN.

NAVAID:

DESCRIPTION

Navaid is used to determine the Altitude and Azimuth of any known celestial body. This can be used to determine what celestial body you may be looking at or to determine where to look for a particular celestial body.

USERS

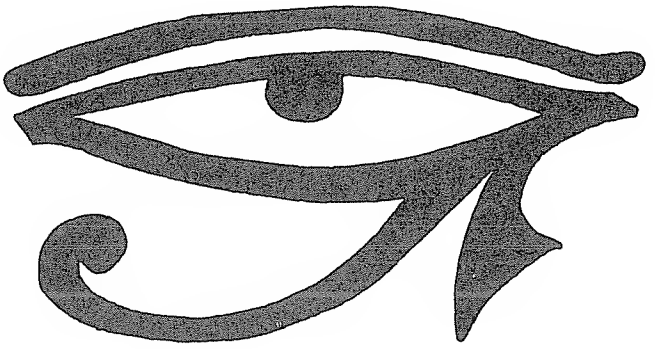
Amateur astronomers and people interested in navigation would find this program useful. It would also be of use to mariners.

INSTRUCTIONS

For detailed program information list the program. All necessary information will be asked for when the program is run.

LIMITATIONS

Navaid should execute without problem in any Basic speaking computer with 5K Bytes of program space available.



```

OPTICAL:

DESCRIPTION

Optical performs blackbody radiation calculations and conversions. It is programmed with look-up tables for various optical elements. The program's calculations are accurate from about 100 Anstroms to microwave wavelengths. The output may be listed and plotted on standard terminals.

USERS

This program would be of considerable use to individuals who measure heat, optical transmissions, or temperatures. Laser engineers, optical military weapon system specialists, S.H.F. communications engineers, etc. Infared specialists will have considerable use for this program in determining complex energy transmissions.

INSTRUCTIONS

The program will prompt for all necessary data while the program is executing. This program will work for any type of Thermal Radiators. The program may be listed for additional information.

LIMITATIONS

This program is 16K Bytes long and may be restrictive due to it's length. It will require an additional 8K Bytes for execution space. It should execute in any Basic system having enough available memory.

Sample Run of Optical

Example #1

This example will illustrate the conversion section of this program. Three light sources will be evaluated at two distances, 50 meters and 10 inches. The first source produces 0.00685 watts/steradians, the second one is 100 watts/meter squared when 50 cm from it and the third is 1 watts/meter sq. when viewed at 25 meters. The 1/r squared dependency is used to determine how the intensity drops off with respect to distance. The converted intensities are tabulated on the second example sheet for the six conditions.

Example #2

In the second example we shall calculate the intensity of a #47 light bulb that stimulates a lead sulfide detector. The detector has a germanium filter placed in front of it and the bulb has a current of 100 mA flowing through it. The results of the calculations are shown on the fourth example page. The temperature of the bulb at 100 mA was measured at 1432 degrees C. The calculations were done over 1.5 to 3.5 microns to reduce calculation time. This will induce almost no error for Germanium doesn't transmit light below 1.6 microns and the bulb has a glass cover that becomes opaque above 3 microns.

The plot on the last page represents the sensitivity of a silicon detector. The plot is from Ø microns to 1.45 microns and the plot is normalized from Ø to 1, left to right. Eight other similar curves are contained in the program.

PLANET:

DESCRIPTION

Planet is a very interesting program. It will list the Altitude and Azimuth of the Sun, Moon and the four (4) brightest planets every hour, for a 24 hr. period; for a specific latitude and longitude.

USERS

Amateur astronomers would be greatly aided by this program. Anyone who plans to do navigation at night could also make good use of this program.

INSTRUCTIONS

The GHA and DEC for the six (6) bodies are entered for Ø hours, for the day of interest in lines 110 and 120. These values are obtainable from a nautical almanac. The program is then run and all additional data is automatically prompted. List the program for detailed program information.

LIMITATIONS

Line 690 contains a Restore statement. This program executes in standard Basic. The source code is 5K Bytes long and the program will execute in 8K Bytes in most systems.

PSD:

DESCRIPTION

PSD stands for Power Spectral Density and that is what this program calculates. This program is extremely versatile as it allows the use of sliding windows, windowing and bit integrating on one or both of the windows. One of the most unique features of this program (not found in private industry) is it's ability to compute two windows simultaneously without Any loss in accuracy. This program is very compact and efficient and can only be enhanced by the addition of file input and output statements. This program computes FFT transforms and inverse transforms as well, thereby making it useable for computing high speed convolutions of complex systems.

USERS

Anyone who needs or desires to examine data in the frequency domain will have use for this program. The dedicated audiophile who wants his equipment to sound good is one example of a user. Noise pollution can easily be examined in the frequency domain with the emphasis on reducing noise, selectively. Other possible users could be persons interested in modeling analog systems of things such as: Missiles, or aircraft, or marine vechiles, or even automobiles. The auto mechanic can use this program to look for troubles before they happen. For example, if the noise of a car engine is viewed in the frequency domain the various interengine components can be seen; if one of them is starting to wear out it's frequency components will shift well before failure can be detected by other means.

INSTRUCTIONS

The program is self contained and will prompt the user for all required information. The program can be listed if additional program information is desired.

LIMITATIONS

The source code is 5K Bytes long. Execution length is a function of the size of the matrix set in the DIM statement in line 190. With the DIM set at 256 points, execution will require 25K Bytes in most systems.

Sample Run of PSD

The data is entered into the program during execution. For this example 32 data points are entered. These 32 points represent 2 cycles of a square wave. These 32 data points will be saved in this sequence throughout the program so that different characteristics of the data may be studied. These 32 data points are entered on the first example page.

The first run uses 16 bit windows and uses HANN windowing on the X data only. The second page lists the FFT of every other data bit. This X and Y matrix listing represents the complex interactions of the two inputs, one with windowing and one without. The PSD for the two conditions is shown at the top of the third example page. The Ø or first bit (#-1) represents the D.C. level of the transformed window. The second and sixth harmonics are predominate in the PSD calculations. Notice the slight effect windowing has on the X matrix when compared to the Y matrix data. The original data is unsymmetrical.

The data is reused again with the two windows still set at 16 bits in length but this time no windowing is used on the X data. These 16 data points now represent one cycle of a square wave. The X and Y data points are set equal. The PSD of this is shown at the top of example page 4. It can be seen that both PSD's are equal and represent just the odd square wave harmonics. This test shows that two windows may be calculated simultaneously without loss in accuracy and also that the program is working properly.

At the bottom of this page the data is run again, here the Y data is slipped 7 bits ahead of the X data/ Again both PSD's are equal indicating proper operation of the program.

On the fourth and final run of the data the Y data is slipped 32 bits ahead of the X data. As there were only 32 bits of data that means all of the Y matrix will be zero. When the PSD is calculated we find that the X matrix is the same as previously calculated, however the Y matrix is approximately zero, which is as it should be as the input data was also zero. There are a number of interesting calculations that can be performed on test data to check out the operating characteristics of FFT's and PSD's, this has been one of them.

RAND 1:

DESCRIPTION

Upon execution this program generates random numbers between Ø and 1. This program may be used as a subroutine in a larger program. Almost every value will be an irrational number.

USERS

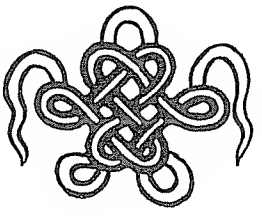
Anyone who needs a random number generator. Rand 1 can be used to set up initial conditions for a program such as a game or an analog simulation.

INSTRUCTIONS

List the program for program information. Type RUN and the program will list the first 100 random numbers to the accuracy of your computer.

LIMITATIONS

This program will store and execute in less then 1K Byte of memory.



```
RAND 1
```

```
10 REM GENERATES RANDOM #'S   0< X <1
20 LET A=4
30 LET A=A/3
50 LET B=(A+R)**8
60 LET R=B-INT(B)
70 LET I=I+1
80 IF I>100 THEN 110
90 PRINT R
100 GOTO 50
110 LET I=0
120 END
```

```
RUN
```

```
.988721231
.238685931
.296056223
.682040811
.173264307
.544727012
```

RAND 2:

DESCRIPTION

Rand 2 generates random numbers between X and Y, where X and Y are integers. This program may be used as a subroutine for a larger program. The generated numbers are all integers.

USERS

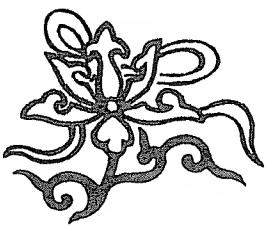
Anyone who needs a specific type of random number generator. Example: only integers between 1 and 6 to simulate dice rolls.

INSTRUCTIONS

Type RUN. Input Y (the largest #) and then input X (the smallest #). Then the program will print the first 100 random numbers between X and Y.

LIMITATIONS

Rand 2 will store and execute in less then 1K Byte of memory.



RAND 2

```
10 REM THIS PROGRAM GENERATES RANDOM #'S BETWEEN  X< R <Y
20 PRINT "TYPE IN THE LOWEST NUMBER DESIRED  -X- "
30 INPUT X
40 X=INT(X)
45 PRINT "TYPE IN THE LARGEST NUMBER -Y- "
50 INPUT Y
55 Y=INT(Y)
60 Y=Y-X
70 A=0.654321
80 A=A*1101
90 J=INT(A)
100 A=A-J
110 R=INT(A*Y+X+.5)
120 I=I+1
130 IF I>100 THEN 160
140 PRINT R
150 GOTO 80
160 I=0
170 END
```

RUN

```
LET Y=100
LET X=1

```

SOLVE:

DESCRIPTION

Solve calculates the roots of any polynomial that has real coefficients.

USERS

This program will find most of it's users to be Engineers, Scientists, Mathematicians and high school students.

INSTRUCTIONS

Initial data must be entered before the program is run. When entering this data use the following format:

```
30 DATA  N,A(N),A(N-1),.....
```

where

N - is the order of the polynomial
A( ) - is the coefficients in descending order

Then type RUN. Bairstow's method is used to solve for the roots. For additional information list the program.

LIMITATIONS

Line 320 contains a Restore statement. Lines 780 and 960 contain ABS( ) statements. The source code will require 5K Bytes of memory for storage and 7K Bytes for execution. The sample problem finds the roots for the following three polynomials.

$3X + 6 = 0$ $X^2 - 6X + 5 = 0$ $3X^3 - 7X^2 + 4 = 0$

SPHERE TRIAN:

DESCRIPTION

This program solves spherical triangles that lie on the surface of the earth. Each must have it's apex at the North Pole.

USERS

Individuals plotting a course for air or sea navigation can use this program to calculate the most direct course.

INSTRUCTIONS

The information about the triangle must be entered before the program is run. The format is as follows:

```
     10 DATA  LTD,LTM,LGD,LGM,RLTD,RLTM,RLGD,RLGM,ALD,ALM
```

where

```
     LTD,LTM   = local latitude in degrees and minutes
     LGD,LGM   = local longitude in degrees and minutes
     RLTD,RLTM = remote latitude in degrees and minutes
     RLGD,RLGM = remote longitude in degrees and minutes
     ALD,ALM   = observed altitude in degrees and minutes
```

South and East are entered as negative numbers. For additional information list the program.

LIMITATIONS

Sphere Trian requires 5K Bytes for storage and should execute in 7K Bytes of memory in most systems.

STARS:

DESCRIPTION

This program lists out the altitude and azimuth of fifty (50) of the most prominent celestial stars.

USERS

Stars will be of use for anyone interested in knowing the location of a particular star. This would include astronomers, mariners and people doing navigation at night.

INSTRUCTIONS

Type RUN and the program will ask for all necessary data. For detailed program information list the program. If an exact position is desired the GHA of Aries will have to be entered.

LIMITATIONS

The source code is 8K Bytes long. Execution of Star requires approximately 11K Bytes of memory.

TRACK:

DESCRIPTION

This program calculates the great circle distance course and track between two locations on the earth, given the Lat. and Long. of your departure and destination.

USERS

Track will be of use to navigators or individuals who plot courses. Aviators and sailors, all classes will be among the users of this program.

INSTRUCTIONS

List the program for detailed program information. Type RUN and the program will request all needed data.

LIMITATIONS

Line 420 contains an ABS( ) statement. The source code for Track requires 4K Bytes of memory and should execute in 6K Bytes.

TRIANGLE:

DESCRIPTION

Triangle will solve for all parts of any plane triangle given one side and any two other parts of the triangle.

USERS

Surveyors, high school students, and anyone else who uses trigonometry can find use for this program.

INSTRUCTIONS

Type RUN and enter your data as asked. For additional information list the program.

LIMITATIONS

Line 105 contains a DEF FNS statement. This is used throughout the program. Triangle's source code requires 4K Bytes of memory to store and 6K Bytes of memory for execution.

VARIABLE:

DESCRIPTION

This program is used to find and list all variables used in another program, written in any Basic. This program will enable the user to know how many variables have been used, what they were used for, and how many are free to be used for other quantities.

USERS

Anyone who is modifying a long program written in Basic will find this program extremely helpful.

INSTRUCTIONS

Before the program is run put the name of your use file after the FILES statement in line 40. Then type RUN. The program will then list the variables it finds in the use file and how the variables are used; refer to the example at the end of the program listing for more information.

LIMITATIONS

Line 90 contains a Restore statement. Line 40 FILES and line 100 Read #1. Starting in line 120 R$ & "___" this and string contantation SST( ) are used extensively throughout this program. The source code will store in 2K Bytes of memory. The amount of space required for program execution is a function of the length of the use file.

VECTOR:

DESCRIPTION

When this program is run it will determine your present latitude and longitude, knowing only the starting point, distance traveled and course.

USERS

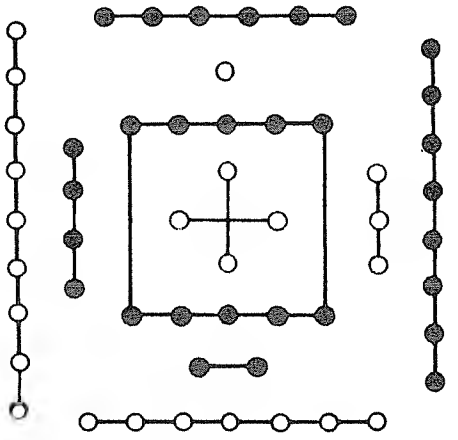
This program will be of assistance to anyone who navigates a boat, airplane or land vehicle. This program doesn't use data derived from a sextant but relies instead on data derived from a compass and/or odometer.

INSTRUCTIONS

The program will ask all necessary questions and prompt you for all inputs. For additional program information list Vector.

LIMITATIONS

Vector's source code is 2K Bytes in length and should execute in 4K Bytes of memory in most systems.



VECTOR

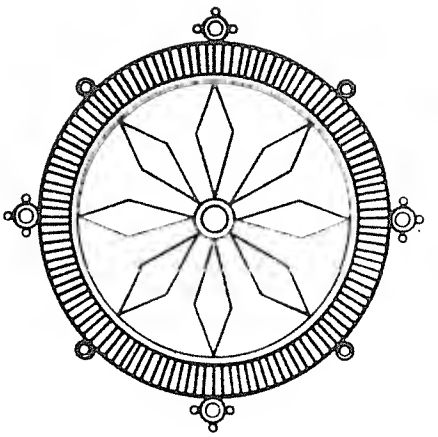
PART 4

PLOTTING

AND

STATISTICS



BINOMIAL:

DESCRIPTION

The Binomial program calculates binomial distributions. The distributions are determined for problems where there are N number of trials and each trial has a probability P of success.

USERS

Gamblers, statisticians and mathematicians will have the most use for this program.

INSTRUCTIONS

When the program is run it will ask if you would like instructions. When asked for P, N and M enter their values. P and N are defined above. Unless this is used for plotting let M = 100. For additional instructions list the program.

LIMITATIONS

This program should store and execute in 3K Bytes of memory in most Basic speaking computer systems.

CHI-SQ:

DESCRIPTION

This program performs a chi-square analysis to samples. This analysis will determine the number of expected results in the sample size and compare it to the actual results obtained. From this the results are determined to be accidental or deliberate.

USERS

Individuals who deal with data samples would find this program quite useful. This program could be utilized by individuals interested in Quality control or parts Reliability.

INSTRUCTIONS

To use this program enter your data starting in line 100. The format for this data is as follows:

```
     100  DATA    N1,S1,N2,S2,N3,S3,.........
```

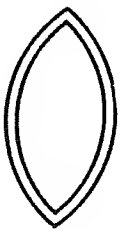
where

N(I) is the sample size
S(I) is the number of successes or failures for the sample

Then type RUN. Additional information may be obtained by listing the program.

LIMITATIONS

The DEF FND statement is used in line 20 of this program. This program should store and execute in 4K Bytes of memory.



CHI-SQ.

COEFF:

DESCRIPTION

Coeff calculates the fourier coefficients of a periodic function which best fits experimental data points or a defining function. The final equation with the calculated coefficients will generate the initial data or equations with only sine and cosine functions.

USERS

Experimenters would have use for this program. Anyone who analyzes data would also find Coeff very useful. The curve may be plotted using one of the plotting programs included in this section.

INSTRUCTIONS

Before the program is run all of the data must be entered in Data Statements. If the data is points of X and Y, enter it starting in line 2000. If the data is in the form of an equation or equations, enter these starting in line 6000. For detailed program instructions list the program.

LIMITATIONS

Starting in line 954 is a Print Using statement. This statement is used extensively throughout the program. The source code for this program is 7K Bytes long. Coeff requires 11K Bytes of memory for storage and execution.

CONFIDENCE 1:

DESCRIPTION

When executed Confidence 1 computes confidence limits for simple linear regressions.

USERS

People engaged in statistical analysis of data will have use for this program.

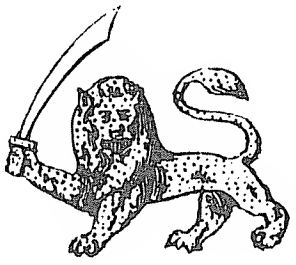
INSTRUCTIONS

Enter the X and Y data into the program before it is run. Enter the X data sequentially starting in line 100, as follows:

```
          100 DATA  X(1),X(2),X(3),.....
and for Y:
          400 DATA  Y(1),Y(2),Y(3),.....
```

LIMITATIONS

A Restore statement is used in line 730. The program will store and execute in 8K Bytes of memory.



CONFIDENCE)

CONFIDENCE 2:

DESCRIPTION

This program calculates confidence limits for an unknown sample mean.

USERS

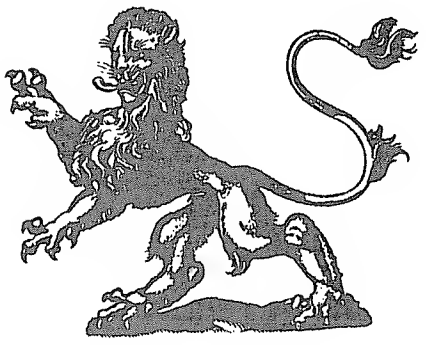
Individuals studying data variables or irregularities within a sample could find this program useful.

INSTRUCTIONS

Enter the sample size in a data statement on line 50. Then enter the data sequentially in data statements starting in line 100. Then type RUN. For additional instructions list the program.

LIMITATIONS

The DEF FN__ is used in program lines 38, 39, 40, and 41. The program should execute in most systems without incident. The source code requires 3K Bytes of memory for storage and will require 4K Bytes for execution.



CONFIDENCE P

CORRELATIONS:

DESCRIPTION

This program will perform auto or cross correlations on data. It plots the results as program output. It will also function for correlations on equations. This will show all points where the two equations have equal components.

USERS

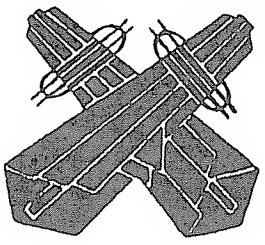
Anyone who would like to compare data sets for subdued characteristics. This would include engineers, statisticians, experimenters, as well as hobbyists to name just a few.

INSTRUCTIONS

If the input is discrete data points, type RUN. The program will prompt for all necessary data. If the input is a function, as in the accompanying example: X(I) = f(I), they must be entered in line 3220 and Y(I) = f(X(I)) must be entered in line 3400. Then type RUN.

LIMITATIONS

The source code for this program will require 6K Bytes of memory for storage. With the DIM statements in line 3070 set at 2200 it will require 50K Bytes of on line memory for execution. If the DIM statements are reduced to 200 then it will execute in 11K Bytes of memory. This will limit the number of data sets to a maximum of 200. In the examples: X(I) = RND(1) and then X(I) for I = 1 to N, step 3 is set equal to 0.5 and Y(I+5) = X(I). In the accompanying plots the correlation at multiples of 3 and 5 are distinctly visible.



NOTE: In these examples the X data is represented by a pulse train, with the pulses Ø.5 unit in amplitude, immersed in noise equal to or greater then the signal and at up to three times the pulse frequency. This signal is very difficult to detect as the S/N is Ø dB. The Y data is the same signal as the X data except it has been displaced to the right by five time or unit intervals. The correlation between these two signals, each buried in noise, is an extreme test of the sensitivity of this program.

CURVE:

DESCRIPTION

This program performs a least squares curve fit for six (6) characteristic curves. The results are tabulated for each curve along with it's index of determination. The six characteristic curves are: Y=X/(A+B*X); Y=1/(A+B*X); Y=A+(B/X); Y=A*(X↑B); Y=A*EXP(B*X); and Y=A+(B*X).

USERS

Anyone could use this program who would like to plot or reduce data. This would include engineers, financial analysts, accountants, statisticians, etc. to name a few.

INSTRUCTIONS

Enter your X data sequentially in the data statements starting in line 100, as follows:

```
          100  DATA    X1,X2,X3,X4,.........
and for Y
          200  DATA    Y1,Y2,Y3,Y4,.........
```

After the data is entered type RUN. The program will prompt for additional input data. For detailed program information list the program. The value of A and B are listed for each of the six curves.

LIMITATIONS

Line 710 contains a Restore statement. The program will require 4K Bytes to store and 13K Bytes of memory for execution. By reducing the DIM statements in line 705 from 200 to a lessor number the program will require less space for execution.

DIFFERENCES:

DESCRIPTION

This program analyzes the differences between the means of two sets of data. The variances for these two sets do not have to be equal.

USERS

This program will find most of it's use among individuals who use statistics frequently in their field.

INSTRUCTIONS

Enter the data starting in line 100 before the program is run. The format is:

```
100 DATA  H1,N1,M1,S1,H2,N2,M2,S2
```

List the program for detailed program instructions. If the data has not been summarized, enter the raw data starting in line 100. Be sure to put data in line 101 or the program may not run properly. List lines 675 to 885 for additional information on entering raw data.

LIMITATIONS

This program requires 4K Bytes for storage and should execute in 7K Bytes of memory in most systems.

DUAL PLOT:

DESCRIPTION

Dual Plot will plot two functions of a single variable. The plot may be done on a standard teletype or terminal without the need for a special plotter.

USERS

Anyone who would like to plot equations could use this program. The equations could be generated from one of the curve fitting programs included in this section.

INSTRUCTIONS

Enter the first equation in line 10 and the second equation in line 20, as follows:

```
10 LET  Y = f(X)
20 LET  Z = f(X,Y)
```

Then type RUN. If only Y = f(X) is desired, then let Z = Ø in line 20 or vice versa. For additional instructions list the program.

LIMITATIONS

Four K Bytes of on line memory is required by this program for storage and execution.

DUAL PLOT

```

EXP-DISTRI:

DESCRIPTION

This program calculates confidence limits for data that is exponentially distributed. The number of samples should be greater then eleven.

USERS

Individuals involved in analyzing experimental data will find this program useful.

INSTRUCTIONS

Enter the raw data starting in line 100 before program execution. Use the following format when entering the data:

```
     100  DATA    X(1),X(2),X(3),.....
```

where

X( ) are the random samples or observations.

After the data has been entered type RUN. For additional information on data entry list the program.

LIMITATIONS

Exp-Distri should execute in 3K Bytes of memory in most systems without any problems.

LEAST SQUARES:

DESCRIPTION

This program uses the least squares method to fit raw data to one of three curves. The raw data is represented by two variables, X and Y. The three curves are: Y=A*EXP(B*X); Y=A+B*X; and Y=A*(X↑B), exponential, linear and power.

USERS

Experimenters will find this program easy to use and the results easily interpreted.

INSTRUCTIONS

Before Least Squares is run the raw data must be entered into the program. Enter the data into data statements starting in line 2. Use the following format for entering the data:

```
2 DATA    X(1),Y(1),X(2),Y(2),X(3),.....
```

The values of A and B are listed for the curve selected. To select the curve type a 1, 2, or 3 when asked 'which curve'. For additional information list the program.

LIMITATIONS

The source code will require 3K Bytes of memory for storage. Execution will require 9K Bytes of available memory. The DIM statement on line 220 sets up a two dimensional array. This array is used through out this program. If the DIM statement is reduced in size the required execution space will also be reduced.

PAIRED:

DESCRIPTION

Paired compares two groups of raw data. It uses the Mann-Whitney rank test to compare the two groups.

USERS

This program best lends itself to individuals in the statistics field.

INSTRUCTIONS

Before running Paired enter the data starting on line 900. List program lines 10 to 87 for instructions on entering your data.

LIMITATIONS

There is MAT Read statements on lines 120 and 150. The source code for this program will store in 2K Bytes of memory. Execution length is 12K Bytes due to the amount of space reserved in the DIM statement on line 90.

RUN

CONFIDENCE INTERVAL BY RANK SUM TEST.
LOWER LIMIT =          2.5      UPPER LIMIT =     57.5
```

The critical value C is composed of two parts. The integer number and it's decimal. The decimal fraction determines the symmetry of the confidence calculations about the two groups of data. The fraction 'Ø.5' is used to generate equal symmetry. The integer number, which should be between Ø and (M*N-1), is used to set the calculation point about both ends of the data groups; as the confidence interval is calculated about the lower portion of the data and the upper protion of the data. A value of (M*N)/2 for the integer would yield a confidence interval about the middle of the two data groups. For this condition C would be equal to (((M*N)/Z + .5). A value of '2.5' for C would be used to determine the confidence interval about the data end points.

PLOT:

DESCRIPTION

This versatile plotting program will plot from one to six functions of a single variable simultaneously. The plotting may be performed on any standard teletype or terminal.

USERS

Experimenters should find this program very useful for displaying a variety of functions. These functions are all plotted on the same scale so these functions can be compared over the plotting interval.

INSTRUCTIONS

Before the program is run the equations must be entered starting in line 100 of the program. For detailed information about the data entry list program lines 3200 to 3560.

LIMITATIONS

This program should execute without incident in most systems with 4K Bytes of available memory.

PLOTPTS:

DESCRIPTION

This program plots data points of a single variable. The plot is a type of bar graph. The plot is done on any standard teletype or terminal. This program will provide a linear or log plot.

USERS

Anyone who gathers data can use this program to make the data visable. This would include experimenters, engineers, astronomers, housewives, etc. A housewife could use this program to plot the grocery usages for her family. From this, usage trends could be visually indicated.

INSTRUCTIONS

Type RUN and the program will prompt for all of the information necessary for execution. For additional information list the program.

LIMITATIONS

There should be no problem in executing this program in most systems, providing there is sufficient memory space available. The program is set up to handle 256 data points. The source code requires 3K Bytes for storage. With the DIM statement in line 1060 set for 256 this program will require 9K Bytes for execution. There is a FILES statement in line 1100. This statement should be removed if your system does not allow file operations.

POLYNOMIAL FIT:

DESCRIPTION

This program performs a least square fit to equate bivariate data to a polynomial. This is done using an orthogonal polynomial method. The limits are an 11th degree polynomial and 100 data points. The polynomials are fitted one degree at a time in ascending order. At each level the index of determination is listed.

USERS

This is one of the most powerful data fitting programs available. Any individual who analyzes or gathers data will find this program ectremely useful.

INSTRUCTIONS

To use the program input data as follows:

```
     10 DATA  N,D
```

where

N is the number of points to be read
D is the lowest degree to be fit

```
     100 DATA  X(1),Y(1),X(2),Y(2),X(3),.....
```

where

X( ) and Y( ) is the raw data

For additional instructions list the program.

LIMITATIONS

Lines 34 and 39 contain DEF FN__ statements. For more then 100 data points, increase the DIM statements in line 25. At the present this program will require 12K Bytes for storage and execution.

REGRESSION:

DESCRIPTION

This program performs a regression analysis on data for up to six variables. This program may be used to fit a random sequence to an observed variable. This is one of the most versatile regression programs available.

USERS

Experimenters will find this program an invaluable aid in matching data to a particular system. One interesting example would be to put a microphone out in a rain storm and digitize the noise the rain makes. This will be the input data for the Y variable. The generating equation is:

```
Y = A + B X1 + C X2 + D X3
```

Then three (3) random number functions are used for inputs to the next three variables; X1, X2, and X3. When the program is run the three coefficients: B, C, and D can represent the gain of three noise amplifiers. When the outputs of these three amps are mixed the sound will resemble the initial rain storm noise. Five generators could have been used, however three is sufficient for this type of analog generation.

INSTRUCTIONS

If transforms are to be used see the following instruction sheet. Data however is entered starting in line 100, for the first variable. Then variable two starting in line 200, variable three in line 300 and so forth. The equation that is fitted is:

```
Y = A + B X1 + C X2 + D X3 + E X4 + F X5
```

where

```
Y - is variable one
X1 - is variable two
X2 - is variable three
and so forth.....
```

After your data has been entered type RUN.

LIMITATIONS

Lines 702 and 882 contain a Restore statement. Matrix statements are in line 711 and 712. Lines 718 and 721 contain MAT Read statements. Lines 732 to 738 contain MAT = ZER statements. Line 761 contains a MAT = INV( ) statement. The source code for this program will require 3K Bytes of memory space for storage. Regression will require 13K Bytes of available memory for execution. If more then 61 data points per variable are required the DIM statement in line 711 will need to be increased.

ADDITIONAL PROGRAM INFORMATION:

LINE NUMBERS 41-699 ARE FREE FOR USE AS DATA STATEMENTS, AS REQUIRED.
ALL VALUES FOR ONE VARIABLE ARE GIVEN IN DATA STATEMENTS, FOLLOWED BY
ALL DATA FOR A SECOND VARIABLE, AND SO ON.
ONE WAY TO ARRANGE INPUT IS TO PUT ALL VALUES OF VARIABLE 1 AT LINES
100-199, ALL FOR VARIABLE 2 AT LINES 200-299, ETC.
IF SEPARATE TAPES ARE MADE FOR EACH VARIABLE, THE FULL USE OF INPUT
FLEXIBILITY CAN BE OBTAINED.

ACCEPTS UP TO 61 OBSERVATIONS ON UP TO 6 VARIABLES. THE ORDER
OF VARIABLES IN THE INPUT IS IMPORTANT ONLY IF TRANSFORMATIONS
ARE NOT BEING USED. IF NO TRANSFORMED VARIABLES ARE GIVEN, THEN
THE PROGRAM FITS A LINEAR FUNCTION FOR THE FIRST DATA VARIABLE
IN TERMS OF THE FOLLOWING VARIABLES. BY USING TRANSFORMS, ANY
FUNCTION OF ANY (OR ALL) OF THE INPUT VARIABLES MAY BE USED AS
ANY VARIABLE IN THE ANALYSIS.
TRANSFORMS ARE ENTERED BEFORE THE RUN, AT LINES 1000-1099 AS:

10XX LET X(J) = ANY FUNCTION OF V(1), V(2),...,V(R)

WHERE X(J) IS THE J-TH VARIABLE IN THE ANALYSIS (J=1 IS THE
DEPENDENT VARIABLE), AND THE V(I) ARE THE INPUT DATA VARIABLES.
THUS, ONE MIGHT ENTER DATA FOR THREE VARIABLES V(1), V(2),
AND V(3), BUT RUN THE ANALYSIS WITH X(1)=V(2) AS THE DEPENDENT
VARIABLE, AND THREE 'INDEPENDENT' VARIABLES, BY ENTERING
TRANSFORMATIONS LIKE THE FOLLOWING AT LINES 1000-1003:

```
1000 LET X(1)=V(2)
1001 LET X(2)=LOG(V(1)+V(3))
1002 LET X(3)=V(1)+X(2)*EXP(-1-V(3))
1003 LET X(4)=(V(3)-1)*2
```

NOTE: IF TRANSFORMS ARE USED, THE PROGRAM EXPECTS AT LEAST
THREE SETS OF INPUT VARIABLES. IF THERE ARE ONLY TWO SETS OF
VALID DATA, A SET OF ZEROS MAY BE INPUT FOR THE THIRD VARIABLE.
HOWEVER, THIS DUMMY SET SHOULD NOT BE USED IN DEFINING THE
TRANSFORMATIONS.

STAT 1:

DESCRIPTION

This statistical program calculates the mean, variance, and standard deviation for several sets of data distributions.

USERS

This program will be of use to individuals who work with data bases. Quality control engineers, reliability engineers, data gatherers, astronomers, experimenters, statisticians are a few of the types of individuals who could find use for this program.

INSTRUCTIONS

Enter all of the data starting in line 1, with data statements before running this program. For information about data format and entry, list lines 900 to 1390. For detailed program information list Stat 1.

LIMITATIONS

Line 345 contains a Restore statement. This program will store and execute in 5K Bytes of memory in most computer systems.

STAT 2:

DESCRIPTION

This program does a statistical analysis on one variable. Once the data for the variable is entered the program calculates 34 different statistical quantities for the data. The data may or may not be weighted. In addition the program calculates a ten class frequency distribution summary.

USERS

Anyone who gathers data for any purpose such as pollsters, surveyers, engineers, experimenters, even fishermen may find uses for this program. For example a fisherman may enter the time of the moon or tide or location versus the number of fish caught. The program will then determine the most likely conditions to catch the most fish.

INSTRUCTIONS

Data must be entered in one of two formats. The two formats are for either weighted or unweighted data. They are as follows:

(1.) FOR WEIGHTED DATA

```
10 DATA  1,X(1),F(1),X(2),F(2),X(3),.....
```

(2.) FOR UNWEIGHTED DATA

```
10 DATA  0,X(1),X(2),X(3),.....................
```

Run the program for additional instructions or list lines 1055 to 1255.

LIMITATIONS

The length of this program is 6K Bytes. The amount of space required for proper execution is a function of the number of data sets in the DIM statement in line 7. With the DIM set for 100 data points, 14K Bytes will be required for execution.

T-DISTRIBUTION:

DESCRIPTION

T-Distribution will perform several types of calculations for normal and T-distributions. If it is given 1 or 2 tailed probabilities it will calculate the corresponding limits. If it is given a variate or set of limits it will calculate the corresponding probabilities.

USERS

Individuals who would like to analyze most types of data will find T-Distribution very useful. In the included example this program is used to calculate the probability that monthly sales for the next period will be within certain limits. The input for the prediction is past sales histories. From this anyone in business or who does ordering for a business could benefit by use of this program.

INSTRUCTIONS

Data must be entered into line 100 prior to running the program. The format for this data and entry information for normal or T-Distributions is given in lines 1360 to 1600 of the program. Standard - t curves are based on a mean of Ø and a sigma of 1.

LIMITATIONS

Starting in line 70 and continuing to line 95 the DEF FN__ statement is used. These functions are used extensively throughout the program. The program will require 5K Bytes for storage and 6K Bytes of memory for operation.

CALCULATIONS FOR A STUDENT'S T-DISTRIBUTION
HAVING A MEAN OF      0 AND A SIGMA OF    1
AND HAVING      17 DEGREES OF FREEDOM.

CASE    THE PROBABILITY OF A VARIATE:

  1       EXCEEDING    2.109843 IS  0.025
```

UNPAIRED:

DESCRIPTION

This program compares various statistical quantities between two groups of unpaired data. These two groups may have unequal variances.

USERS

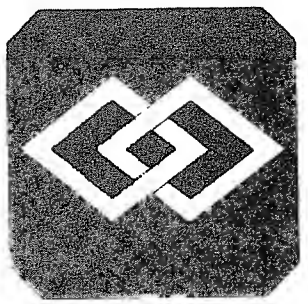
Again users of this program will be individuals who analyze data, regardless of the source.

INSTRUCTIONS

Enter the data for group one (1) starting in line 900 and enter the corresponding data for group two (2), starting in line 950, before program execution. For additional information list the program.

LIMITATIONS

This program should store and execute in 3K Bytes of memory in most computer systems.



UNPAIRED

VARIANCE 1:

DESCRIPTION

This program performs a one way analysis of variances with equal sample sizes. There may be several different samples as long as each sample has the same number of data points.

USERS

Metalurgists, experimenters, and persons who would like to compare system operating characteristics could all use this program effectively. In the example given, the program must analyze the effects of an impurity on the tensile properties of three sample alloys.

INSTRUCTIONS

Starting in line 100 enter the data in Data Statements before the program is run. Use the following format for entering the data:

```
100 DATA  M,N
200 DATA  X11,X12,X13,.........
201 DATA  X21,X22,X23,.........
          and so forth until all the samples are entered
```

where

M = The number of samples
N = The number of data per sample (all samples must be the same size)
XIJ = The sample data (the data may be contained on additional lines if necessary)

List Variance 1 for additional information.

LIMITATIONS

In line 27 there is a DEF FND statement. This program will require 3K Bytes of memory for storage and will execute in 4K Bytes.

VARIANCE 2:

DESCRIPTION

This program calculates the analysis of a variance table for a one-way design. The design may be completely randomized. The input data must be in the form of a table where different events and their observations are listed.

USERS

Statisticians will find the most use for this program.

INSTRUCTIONS

Before the program is run the problem data must be entered, starting in line 900. For a complete set of instructions for program operation list the program. After the data has been entered type RUN.

LIMITATIONS

Line 91 contains a Restore statement and line 115 contains a MAT Read statement. In the DIM statement in line 100, provision is made for a two dimensional array. The source code for this program requires 3K Bytes of memory for program storage and it will require 6K Bytes of memory for storage and execution.

XY:

DESCRIPTION

This plotting program plots single valued functions in X on a standard teletype. The X axis is the vertical axis. The plots that are drawn are linear plots. Log plots may be done by setting Y = LOG(f(X)) but the axis will still indicate a linear grid.

USERS

Anyone who would like to plot functions whether for business or pleasure will find this program easy to use.

INSTRUCTIONS

The function that is to be plotted will have to be entered in line 2030 before the program is run. After the function has been entered type RUN. For additional information list the program.

LIMITATIONS

This program should execute without incident in most systems that have 3K Bytes of available memory space.

APPENDIX A

BASIC

STATEMENT

DEFINITIONS

SEE APPENDIX B FOR CONVERSION ALGORITHMS FOR OTHER BASICS

STATEMENT DEFINITION

Each BASIC statement consists of the following elements arranged in the order given:

Statement (or line) number - by its ascending order, indicates the processing sequence of the statement.

BASIC word - specifies the computer operation to be performed.

Parameters - in most statements are variables, expressions, and numbers used in or to direct the operation performed by the statement.

MATHEMATICAL NOTATION AND OPERATIONS WITHIN A STATEMENT

Variable Representation

In the BASIC language, a variable can be represented by

1. a letter
2. a letter and a digit
3. either of the above, followed by the character $

For example A,Z,K6, and X may represent variables, but AR, Z12, 6K, and 22 can not. The inadvertent use of the digit 0 for the letter O (and vice versa) in a variable will cause errors in a program; use of the letter O or the digit 0 in variable representation is not recommended. The user may find choice of a letter as a mnemonic for a variable helpful; for example, P for price, S for sales, and N for numbers.

Variables with $'s are restricted to the assignment of strings (alphanumeric data) and are referred to as "string variables", in contrast to variables without the $ that are referred to as "numeric variables". Numeric variables, when used as a starting point in calculations (e.g., for a counter), have an initial value of zero. String variables have an initial value of zero when used for character count.

A BASIC variable is assigned a value, during the execution of a program, from the numbers given in a related LET, FOR, READ, or INPUT statement. It retains this value during the processing, unless it is reassigned a new value by another of these statements.

List and Table Variables

Subscripted variables are represented in BASIC as

variable name (subscript)
or
variable name (subscript, subscript)

where the subscript can be an integer, variable, or an arithmetic expression such as (1+K) or (A(3,7),B-C). The subscript must always be enclosed by parentheses. Subscript values should begin at 1 (i.e., not 0).

A list variable designates an element of a one-dimensional array that can be represented by such as P(15), P(H) or L(20). Before a list variable can be used in any statement, the maximum value of its subscript (i.e., size of list) must be specified in a DIM statement; otherwise a list of 10 or less is implied.

A table variable designates an element of a two-dimensional array that can be represented by such as S(15,17) or T(20,30). Before a table variable can be referenced in any statement, the maximum value of its subscripts must be specified in a DIM statement; otherwise, subscripts of 10 or less are implied.

Use of Numbers

A number may be positive or negative, may contain up to nine digits, and must be in decimal form. BASIC would accept 0.01, 2, -3.675, 123456789, -.987654321, and 483.4156 as numbers, but would reject 14/3 (this is an expression) or 32,437 (as representing 32437). Numbers are stored as single-precision floating-point values.

A number can also be expressed in "E notation", which is equivalent to expressing it as a power of 10. For example, in E notation,

0.00123456789	may be expressed as	0.123456789E-2 or 12.3456789E-4
1967		1.967E3 or 19.67E2
10,000,000		1E7 or 100E5

The decimal point can be positioned anywhere within the number as long as the integer following the E indicates its correct position. Note that E and an exponent alone cannot represent a number. For example, E7 cannot be written as a number to represent 10,000,000; it must be written as 1E7 to indicate 1 multiplied by 10 to the 7th power.

Arithmetic Operations

Five arithmetic operations can be performed by BASIC. Each of the following symbols represents an arithmetic operation that can be included in an expression.

Operator symbol	denotes	as illustrated by
+	addition	A + B
-	subtraction	A - B
*	multiplication	A * B
/	division	A / B
↑ or **	raise to a power	A ↑ B or A ** B

Relational Symbols

Six relational tests can be made with BASIC. Symbols representing these relationships can be used in statements when comparisons are required. The symbols and illustration of their use follow.

Relational symbol	denotes	as illustrated by
=	is equal to	A = B
<	is less than	A < B
<= or =<	is less than or equal to	A <= B or A =< B
>	is greater than	A > B
>= or =>	is greater than or equal to	A >= B or A => B
<> or ><	is not equal to	A <> B or A >< B

Function	means find the
SIN(X)	sine of X
COS(X)	cosine of X
TAN(X)	tangent of X
COT(X)	cotangent of X
ATN(X)	arctangent of X
EXP(X)	e to the power X
LOG(X)	natural logarithm of X
CLG(X)	common logarithm of X
ABS(X)	absolute value of X
SQR(X)	square root of X

In these definitions, the letter X represents an expression, which, for the trigonometric functions, implies an angle measured in radians. If the value of X in LOG(X), CLG(X), or SQR(X) is negative, then the negative sign is ignored, the positive value is used, and an error message is printed.

Four additional mathematical functions are included in BASIC.

Function	means
INT(X)	truncate X
RND(X)	produce a random number
SGN(X)	sign determination
DET(X)	provide determinant of last matrix inverted

In addition, the user may employ the DEF statement to define one or more of his own functions.

Miscellaneous Functions

A set of miscellaneous functions is available for use to provide a variety of non-mathematical operations. These are as follows:

Function	means obtain
TIM(X)	elapsed processor time
CLK$	time of day
DAT$	calendar date
NUM(X)	count of matrix data elements
SST(X$,Y,Z)	selected characters of a string (substring)
TAB(X)	character print position
SPC(X)	space print position
LEN(X$)	number of characters in string
LIN(X)	last line number encountered in reading/writing file

BASIC WORDS

BASIC words are short, distinctive, easily recognizable words that are either valid words or abbreviations of words. When formatted into a statement, a word becomes an explicit instruction to the computer to perform some operation. Some statements can be made by the use of a BASIC word alone; other statements require other information in addition to the BASIC word.

BASIC words may be grouped by type of statements in which they occur. The words and their associated functional statement categories are as follows:

Arithmetic Statements

BASIC Word	When formatted into a statement
DEF	- defines a repeatedly used function
LET	- requests a computation or manipulation upon an arithmetic variable
MAT	- requests a computation or manipulation upon a matrix

Specification Statements

BASIC WORD	When formatted into a statement
CHANGE	- converts string characters to numerical code or vice versa
DATA	- specifies numeric values for variables listed in a READ statement
DIM	- reserves space for list or table

Input/Output Statements

BASIC Word	When formatted into a statement
INPUT	- delays input of values to variables until program is in execution; program will request input of data by terminal user or a user's file when statement is executed
PRINT	- prints computed results; prints text - prints computed results and text - skips lines - formats output data
PRINT USING	- formats output line
READ	- reads values from a DATA statement or user's file and assigns them to designated variables
RESTORE	- restores previously processed blocks of input data from DATA statements

Loop and Subroutine Statements

BASIC Word	When formatted into a statement
CALL	- directs processing sequence to a subroutine previously saved
FOR	- is first statement of a loop and sets conditions of loop
NEXT	- is last statement of loop
GOSUB	- directs processing sequence to a subroutine
RETURN	- returns processing sequence from a subroutine

Logic Statements

BASIC Word	When formatted into a statement
GOTO	- unconditionally transfers the processing sequence to a designated statement
IF-----THEN or IF---GOTO-	conditionally transfers the processing sequence to a designated statement

ON-----THEN
or
ON---GOTO- conditionally transfers the processing sequence to designated statements

STOP - stops the execution of the program

END - indicates end of program

Documentation Statement

BASIC Word	When formatted into a statement
REM	- inserts a remark into the statement sequence

For all Matrices operations the subscripts are defined as follows:

```
     DIM    A(3,4)
where
     3 = # of rows
     4 = # of columns
```

ie: If the following data were input to the above A matrix it would be stored as:

Input Data = 1,2,3,4,5,6,7,8,9,10,11,12

Matrix				
	1	2	3	4
	5	6	7	8
	9	10	11	12

Function ASC(X)

Purpose: To provide the numeric value of a specified character or, for the case of non-printing characters, an abbreviation.

Format: ASC { (character) / (abbreviation) }

Function SPC(X)

Purpose: To insert spaces at indicated positions within an output line.

Format: SPC(expression); <data to be printed>

Function TAB(X)

Purpose: To position data field at indicated character position within an output line.

Function NUM(X)

Purpose: To supply count of number of data elements in response to request from MAT INPUT statement.

Format: NUM (any alphanumeric character)

File read statements

```
READ # file designator, input list
INPUT # file designator, input list
```

File write statements

```
WRITE # file designator, output list
PRINT # file designator, output list
PRINT # file designator, USING statement number, output list
```

Matrix input statements

```
MAT READ # file designator, matrix input list
MAT INPUT # file designator, matrix input list
```

Matrix output statements

```
MAT WRITE # file designator, matrix output list
MAT PRINT # file designator, matrix output list
```

File manipulation statements

```
SCRATCH # file designator
RESTORE # file designator
BACKSPACE # file designator
```

Function LEN(X$)

Purpose: To determine the number of characters in a specified string variable.

Format: LEN(string variable)

Function VAL(S$)

Purpose: To produce a numeric value corresponding to the value of a string represented by a string variable.

Format: VAL (string variable)

Function SST(X$,Y,Z)

Purpose: To extract selected characters of a string.

Format: SST(string variable, beginning character, number of characters)

Function STR$(N)

Purpose: To produce a string corresponding to a value of a number represented by an expression.

Format: STR$ (expression)

Use of STR$ implies placement of the string right-justified in the smallest zone into which it will fit. Blanks will occupy the remaining character positions of the zone.

CHANGE

The change statement may be used to convert string characters to equivalent numeric code or vice versa.

The process involves two lists, one numeric, the other a string variable. When converting numeric codes to a character string, the numeric list is to contain the valid numeric equivalent of a single character in each element. Given the desired number of items to convert, the CHANGE command will perform the conversion and concatenate the resulting characters into the string variable.

In changing from a character string, the command stores the related numeric code for each character into the elements of the numeric array.

String concatenation is limited within one LET statement to two string variables or one string constant and one string variable.

The statements

```
*10 LET A$ = "JOHN DOE "
*20 LET B$ = "EMPLOYEE NUMBER 12345"
*30 LET C$ = A$ & B$
*40 PRINT C$
```

or

```
*10 LET A$ = "JOHN DOE "
*20 LET C$ = A$ & "EMPLOYEE NUMBER 12345"
*30 PRINT C$
```

when executed, will produce the printout

```
JOHN DOE EMPLOYEE NUMBER 12345
```
